

Formal investigation of the expressiveness of the Extended UTxO model

Laying the foundations for the formal verification of smart contracts

ORESTIS MELKONIAN, Utrecht University, The Netherlands

This report serves as the proposal of my MSc thesis, supervised by Wouter Swierstra from the University of Utrecht and Manuel Chakravarty from IOHK.

1 INTRODUCTION

Reasoning about the behaviour of blockchain ...

The advent of smart contracts (programs that run on the blockchain itself) gave rise to another source of vulnerabilities. Since these (possibly Turing-complete) programs often deal with transactions of significant funds, it is of utmost importance that one can reason and ideally provide formal proofs about their behaviour in a concurrent/distributed setting.

Research Question. The aim of this thesis is to provide a mechanized formal model of ..., in which one can begin to formally investigate the expressiveness of the extended UTxO model. Moreover, ... compare with account-based ... Ethereum ...

Put concisely, the research question posed is:

*How much expressiveness do we gain by extending the UTxO model?
Is it as expressive as the account-based model used in Ethereum?*

Overview. Section 2 will review some basic definitions related to blockchain technology and introduce important literature, which will be the main subject of study throughout the development of our reasoning framework.

Section 3

Section 4

Section 5

2 BACKGROUND

2.1 Distributed Ledger Technology: Blockchain

2.2 Smart Contracts

2.3 UTxO-based: Bitcoin

SCRIPT. ...

The BitML Calculus. Bad documentation ... scarcity of formal models ... bitML ...

Extended UTxO. ...

2.4 Account-based: Ethereum

Solidity.

3 METHODOLOGY

3.1 Proof Mechanization

Through mechanization ... vs informal mathematics ...

It is exactly this side effect, that will allow us to discover edge cases and increase the confidence of the model under investigation.

As our proof development vehicle, we choose Agda...

3.2 Agda

... stay on a highly abstract level ... postulate cryptographic operations etc ...

Limitation. ... proof automation ala Coq ...

3.3 The IOHK approach

... rigorous methodology ... industry co-existing with academia ... formal verification (Agda/Coq) -> prototype/reference implementation (Haskell) -> production codebase (Haskell) ...

3.4 Functional first

... UTxO vs Account ... functional vs imperative ... dataflow vs ?? ...

4 PRELIMINARY RESULTS

4.1 Formal Model I: Extended UTxO

4.1.1 *Inherently-typed validity of transactions.*

4.1.2 *Scripts via Denotational Semantics.*

4.1.3 *Address space as module parameter.*

4.1.4 *Weakening Lemma.*

4.1.5 *Example.*

4.2 Formal Model II: BitML Calculus

4.2.1 *Contracts in BitML.*

4.2.2 *Small-step Semantics.* ... mention paper bug in [C-Control] ...

4.2.3 *Configurations modulo permutation.*

4.2.4 *Example.*

4.3 Expected Problems

... up to permutation -> quotient types -> homotopy type theory ...

5 PLANNING

5.1 Extended UTxO

... multi-currency ...

5.2 BitML Calculus

... symbolic runs ... computational runs ... coherence

5.3 UTxO-BitML Integration

5.4 Featherweight Solidity

5.5 Formal Comparison

... lots of examples ...

Formal investigation of the expressiveness of the Extended UTxO model

Fig. 1. My workplan.

5.6 Proof Automation

5.7 Timetable
